The first question is whether the model is *internally valid* – that is, whether it accurately represents the relationships between the variables in the population. This is a crucial question because if the model is not internally valid, then any conclusions drawn from it will be unreliable. To assess internal validity, we need to consider the following factors:

1. **Identify the main components of the system.**
 2. **Describe the function of each component.**
 3. **Explain the interactions between the components.**
 4. **Discuss the advantages and disadvantages of the system.**
 5. **Conclude with a summary of the findings.**
