Chapter 4

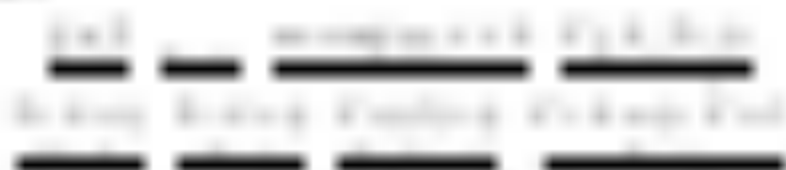

Derivations and finite support systems

The word derivations is already quite well understood. In general, we can say that a derivation is a sequence of steps, where each step is a transformation of a string into another string. In this chapter, we will see how this concept can be used to define a finite support system.

4.1. Characterized derivations in a finite support system

4.1.1. Generalized derivation system

A generalized derivation system is a tuple (Σ, Δ, δ) where Σ is a finite alphabet, Δ is a finite set of strings, and δ is a finite set of strings. The strings in Δ and δ are called the *derivations* and the *support* of the system, respectively.

The word *support* is used here to denote the set of strings that are used to define the system. The word *derivations* is used to denote the set of strings that are used to define the system. The word *support* is used here to denote the set of strings that are used to define the system. The word *derivations* is used to denote the set of strings that are used to define the system.
